In this paper, viscous flow with a second-order slip condition over a permeable stretching surface is solved analytically. The current work differs from the previous studies in the application of a new second-order slip velocity model. The closed form solution reported is an exact solution of the full governing Navier-Stokes equations. The effects of slip and mass transfer parameters are discussed.

\textit{Key words:} Similarity Solution; Stretching Surface; Navier-Stokes Equations; Analytical Solution; Exact Solution; Slip Flow.
