Spirocyclic Sulfonamidosilanes, 1,2-Phenylene Diamides, Capped Tetrahedron, X-Ray Data, Chelation

The first synthesis of spirocyclic tetrasulfonamidosilanes is described. According to the X-Ray structure analysis of the most stable tetratosylamidosilane obtained the Silicon is bonded to four Nitrogen atoms in a spirocycle and surrounded by four Oxygen atoms which are located above the planes of the SiN\textsubscript{4} tetrahedron.
