Guaianolide, *Cichorium intybus*, Chicory

Ten guaianolides, including three previously unreported natural products, were isolated from the aerial parts of *Cichorium intybus* (Asteraceae), more commonly known as chicory. Two of the new compounds (8 and 9) were analogues of lactupicrin and 11β,13-dihydrolactupicrin, respectively, with the C-15 oxidized to the aldehyde state. The third new natural product, which we have called intybulide A (10), is an isomer of lactucin with the lactone closed to the C-8 oxygen rather than the C-6.
