Unsymmetrical oxalic acid-bis(imidoyl)dichlorides were prepared from ethyl 2-chloro-2-oxoacetate in three steps.

Key words: Imidoyl Chlorides, Oxalyl Derivatives, Pigments

Oxalic acid bis(imidoyl)dichlorides have been first reported by Wallach in 1879 [1]. After initial studies of the reactivity of these compounds [2, 3], Beckert and coworkers reported on the synthesis of a great variety of symmetrical, aryl-substituted derivatives based on the work of Wallach [4]. The synthesis of alkyl-substituted bis(imidoyl)chlorides is problematic, due to their unstable nature. Beckert and our group reported on cyclization reactions of symmetrical bis(imidoyl)dichlorides with a variety of bis(nucleophiles) [5]. Recently, the first examples of *unsymmetrical* oxalic acid bis(imidoyl)dichlorides have been reported by Beckert [6] and by our group [7]. Herein, we wish to report full details of our approach

to unsymmetrical bis(imidoyl)dichlorides based on a three-step synthesis starting with ethyl 2-chloro-2-oxo-acetate.

The reaction of ethyl 2-chloro-2-oxoacetate with a number of anilines **1** gave the ethyl 2-oxo-2-(arylamino)acetates **2** (Scheme 1) [8]. The reaction of **2** with a variety of anilines afforded the novel unsymmetrical oxalamides $3\mathbf{a} - \mathbf{j}$ (42-83%). Reflux of a toluene solution of oxalamides **3** with phosphorus pentachloride (PCl₅) afforded, after recrystallization from *n*-heptane, the unsymmetrical oxalic acid bis(imidoyl) dichlorides $4\mathbf{a} - \mathbf{j}$ (23-77%). During the optimization of this transformation, the quality of PCl₅, the reaction time (1 h, reflux), the absence of water and the conditions for recrystallization (*n*-heptane) proved to play an important role.
