

Eine leistungsfähige Synthese von Lepidokrokit (γ -FeOOH) durch Homogenfällung

An Efficient Synthesis of Lepidocrocite (γ -FeOOH) by
Homogeneous Precipitation

Well crystallized lepidocrocite (γ -FeOOH) with high phase purity can be prepared by precipitation from homogeneous solution. FeCl_2 is oxidized with NaClO_3 while heating the common solution slowly from 20 to 75 °C. Due to the buffer pyridine/HCl the pH-value changes only from 6.3 to 5.3. The product with the specific surface of about $16 \text{ m}^2/\text{g}$ has been characterized by several methods, especially by thermal analysis.

Key words: Lepidocrocite, FeOOH (γ), Iron Oxide
Hydroxide, Synthesis, Homogeneous
