*Z. Naturforsch.* **2007**, 62b, 272–274; received August 14, 2006

A new eudesmane sesquiterpene glycoside, named funingensin A (**1**), together with a novel cyclic ether based on the cadalane skeleton, named funingensin B (**2**), were isolated from the roots of *Parepigynum funingense*. Their structures were elucidated by spectroscopic methods, including one- and two-dimensional NMR (COSY, HMQC, HMBC and ROESY).

*Key words:* *Parepigynum funingense*, Eudesmane Sesquiterpene, Cadalane Sesquiterpene
