**Centaurea deusta**, Sesquiterpene Lactones, Antifungal and Antibacterial Activity

The aerial parts of *Centaurea deusta* Ten. afforded in addition to several known compounds, mainly sesquiterpene lactones, one new eudesmanolide and one new elemene derivative. Structures of the new compounds were elucidated by spectroscopic methods. The *in vitro* antifungal and antibacterial activities of the isolated compounds was tested, using the microdilution method. All compounds tested showed high antifungal activity.
