It was the objective of the present study to increase the production of glucoamylase by *Aspergillus awamori* through solid state fermentation, using wheat bran as the main carbon source and (NH₄)₂SO₄, urea, KH₂PO₄, glucose, maltose and starch as additional nitrogen, phosphorus, and carbon sources. The production of glucoamylase is strongly influenced by N and C sources. A 100% increase was observed when the (NH₄)₂SO₄ was replaced by urea, with C/N = 4.8, using maltose as the additional carbon source. C/P ratios in a range of 5.1 to 28.7 did not induce glucoamylase production under the studied conditions.

**Key words:** *Aspergillus awamori*, Glucoamylase, Solid State Fermentation
