A number of new disubstituted 2,5-thiazolidinone derivatives were synthesized and tested for their antimicrobial activity against \textit{Bacillus subtilis} (Gram-positive), \textit{Pseudomonas aeruginosa} (Gram-negative), and \textit{Streptomyces} species (Actinomycetes). They displayed different degrees of antimicrobial activities or inhibitory actions.

\textbf{Key words:} Thiazolidinones, Diaza-1,3-thiazole, Antimicrobial Activity
