#### Abstract

A series of new 4-aryl-1-(biarylmethylene)piperidines have been synthesized. They are structurally related to SLV-313, a potential atypical antipsychotic agent with potent $\mathrm{D}_{2}$ receptor antagonist and $5-\mathrm{HT}_{1 \mathrm{~A}}$ receptor agonist properties. Suzuki-Miyaura reaction of cyclic vinyl boronates, derived from the vinyl triflates of $N$-protected tetrahydropyridines, with appropriate aryl halides yielded 4-arylpiperidines. The reductive amination of the latter with suitable biarylaldehdyes accomplished the synthesis of the new compounds.

## Introduction

Schizophrenia is a complex lifelong chronic neuropsychiatric illness, afflicting approximately $1 \%$ of the world population. The symptoms of the disease can be grouped as positive and negative. Positive symptoms include delusions, hallucinations, and conceptual disorganization. The most characteristic negative symptoms are affective flattening, social withdrawal, anhedonia, and poverty of thought and content of speech [1]. The typical antipsychotic drugs, for example haloperidol or chlorpromazine, were the most widely used drugs for this disease because they block $D_{2}$ receptors. However, although the blockade of $D_{2}$ receptors improves the positive symptoms, the development of neurological side effects such as dystonia, muscle rigidity, tremor and akathisia, and tardive dyskinesia, and in particular of extrapyramidal side effects (EPS) [2,3] undermine compliance. Various atypical or second-generation antipsychotics, such as clozapine and more recently aripiprazole have been developed to reduce EPS liability and to treat negative symptoms. The atypical antipsychotics combine $\mathrm{D}_{2}$ receptor antagonism with activity at other receptors such as serotonergic receptors, on the premise that a suitable balance of pharmacological activity should broaden the spectrum of therapeutic efficacy and reduce EPS. It has been demonstrated that the combination of a dopamine $D_{2}$ receptor antagonist with 5-
$\mathrm{HT}_{1 \mathrm{~A}}$ receptor agonist properties could improve the therapeutic window, side-effect profile and therapeutic efficacy of antipsychotic agents [4]. As a result adoprazine (1) (SLV-313) and bifeprunox (2), possessing potent $\mathrm{D}_{2}$ receptor antagonist and $5-\mathrm{HT}_{1 \mathrm{~A}}$ receptor agonist properties, were developed [5]. However, the failure of $\mathbf{1}$ and $\mathbf{2}$ to oppose phencyclidine-induced social interaction deficits suggested that an appropriate 'balance' of activity at these sites is necessary for activity in this model [4]. Thus, the need to discover compounds having varying ratios of $\mathrm{D}_{2}$ and $5-\mathrm{HT}_{1 \mathrm{~A}}$ activities continued [6]. This report describes the synthesis of a series of new 4-aryl-1-(biarylmethylene)piperidines $\mathbf{3 a}-\mathbf{f}, \mathbf{4 a}-\mathbf{f}$ and $\mathbf{5 a}-\mathbf{f}$, structurally related to $\mathbf{1}$ (Fig. 1).

## Results and Discussion

The synthesis of compounds $\mathbf{3 a}-\mathbf{f}, \mathbf{4 a}-\mathbf{f}$ and $\mathbf{5 a}-$ $\mathbf{f}$ required the synthesis of aldehydes $\mathbf{6 b}-\mathbf{f}$. Suzuki reaction of 4-bromobenzaldehyde with 4-fluoroboronic acid yielded $\mathbf{6 b}$ whereas the reaction between 5bromonicotinaldehyde (7) with the appropriate boronic acid gave the desired aldehydes $\mathbf{6 c}$ and $\mathbf{6 d}$ [7-10]. The known aldehydes $\mathbf{6 e}$ and $\mathbf{6 f}$ were synthesized from their corresponding bromides 8 and 9 by employing literature-known procedures [11] (Scheme 1).

The synthesis of the required arylpiperidines was commenced from lithiation of $\mathbf{1 0}$ in THF at $-78^{\circ} \mathrm{C}$ fol-

Fig. 1. 1-Aryl-4-(biarylmethylene)piperidines $\mathbf{3 a}-\mathbf{f}, \mathbf{4 a}$ - $\mathbf{f}$ and $5 \mathbf{a}$ - $\mathbf{f}$.

lowed by quenching with $N$-protected piperidinone 11 to obtain alcohol 12 in $68 \%$ yield. The dehydration of the latter was ensued by refluxing it in concentrated HCl and MeOH to generate compound $\mathbf{1 3}$ in a moderate yield. To produce the desired intermediate $\mathbf{4}$ from compound 13, removal of $N$-protection and reduction of the double bond were required. Hence compound 13 was subjected to hydrogenation in a Parr apparatus at $60 \mathrm{psi}(1 \mathrm{psi}=6894.757 \mathrm{~Pa})$ for 5 h . The benzyl deprotection, however, proved to be stubborn, and the
reaction yielded a mixture of products which were difficult to separate (Scheme 2).

Thus, the desired intermediates 4 and 5 were synthesized by an alternative route as outlined in Scheme 3. Suzuki-Miyaura reaction of cyclic vinyl boronates $\mathbf{1 4}$ [12], derived from the vinyl triflates of $N$ protected tetrahydropyridines, with bromoquinoline 10 generated compound 15. Hydrogenation of intermediate $\mathbf{1 5}$ in a Parr apparatus at 50 psi for 6 h followed by column-chromatographic purifications on silica gel produced intermediates $\mathbf{1 6}$ and $\mathbf{1 7}$ in a ratio of $3: 7$. Exposure of compounds $\mathbf{1 6}$ and $\mathbf{1 7}$ to trifluoroacetic acid at room temperature smoothly furnished the desired intermediates $\mathbf{4}$ and 5 in high yields (Scheme 3).

Likewise, to synthesize the required intermediate 3, Suzuki-Miyaura reaction of cyclic vinyl boronates 14 with bromoquinoline 18 [13] generated compound 19, which in turn was hydrogenated at 50 psi for 7 h to furnish intermediate 20. Exposure of the latter to trifluoroacetic acid at r.t. smoothly produced the desired intermediate 5 in an overall yield of $36 \%$ from 18 (Scheme 4).

dine 3 (dppf $=1,1^{\prime}$-bis(diphenylphosphino)ferrocene).

Scheme 5. Synthesis of 1-aryl-4-(biarylmethylene)piperidines $\mathbf{3 a}-\mathbf{f}, \mathbf{4 a}-\mathbf{f}$ and $\mathbf{5 a}-\mathbf{f}$, a representative example.

Having the desired arylpiperidines $\mathbf{4}$ and 5 and biarylaldehdyes $\mathbf{6 b}-\mathbf{f}$ in hand, we next performed the reductive amination in 1,2-dichloroethane, using $\mathrm{NaBH}(\mathrm{OAc})_{3}$ as reducing agent to obtain the desired piperidines $\mathbf{3 a}-\mathbf{f}, \mathbf{4 a}-\mathbf{f}$ and $\mathbf{5 a}-\mathbf{f}$ (Scheme 5).

## Conclusion

In conclusion we have accomplished the synthesis of a series of new 1-aryl-4-(biarylmethylene)piperidines, $\mathbf{3 a}-\mathbf{f}, \mathbf{4 a - f}$ and $\mathbf{5 a - f}$, structurally related to SLV313.

## Experimental Section

1-Benzyl-4-(2-(benzyloxy)quinolin-8-yl)piperidin-4-ol (12)
A solution of 2-(benzyloxy)-8-bromoquinoline 10 ( 2.0 g , 6.4 mmol ) in THF ( 20 mL ) was added dropwise over 10 min to a solution of $n$-BuLi ( $2.5 \mathrm{~m}, 2.8 \mathrm{~mL}, 7 \mathrm{mmol}$ ) in hexane cooled to $-78^{\circ} \mathrm{C}$. The mixture was stirred for 1 h at $-78^{\circ} \mathrm{C}$, and a solution of 1-benzylpiperidone $11(1.21 \mathrm{~g}, 6.4 \mathrm{mmol})$ in THF ( 10 mL ) was added dropwise over a period of 10 min , maintaining the reaction temperature at $-78^{\circ} \mathrm{C}$. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 0.5 h and at $-10^{\circ} \mathrm{C}$ for 1.5 h whereupon a saturated solution of ammonium chloride ( 4 mL ) was added. The reaction mixture was stirred and warmed to r.t. Water ( 50 mL ) was added, and the reaction mixture was extracted with dichloromethane $(3 \times 30 \mathrm{~mL})$. The combined organic extracts were washed with water, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and filtered. The solvent was removed under reduced pressure, and the crude product was purified by flash chromatography ( $1 \mathrm{~m} \mathrm{NH}_{3}$ in $\mathrm{MeOH} /$ dichloromethane, $2: 98$ to $7: 93$ ) to afford the title compound as a dark-brown thick oil $(1.84 \mathrm{~g}$, $68 \%$ ). - IR (neat): $v=3365,3042,3032,2971,1607,1485$, 1260, $1192 \mathrm{~cm}^{-1}$. - ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=2.15$ (br. s, 4 H , piperidine H ), $2.73-2.78(\mathrm{~m}, 5 \mathrm{H}$, piperidine H , $\mathrm{OH}), 3.62\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{NCH}_{2}\right), 5.43\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{OCH}_{2}\right), 6.99(\mathrm{~d}$, $J=9.0 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}), 7.23-7.47(\mathrm{~m}, 11 \mathrm{H}$, aromatic H), $7.60(\mathrm{~m}, 2 \mathrm{H}$, aromatic H), 8.04 (d, $J=8.5 \mathrm{~Hz}, 1 \mathrm{H}, 4-\mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR ( $125.7 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=37.26,49.46$ (all C ${ }_{\text {piper }}$ ), $53.02\left(\mathrm{OCH}_{2}\right), 63.52\left(\mathrm{NCH}_{2}\right), 68.48\left(\mathrm{C}_{\text {piper }}\right), 113.21(\mathrm{C}-3)$, $124.75,126.30,127.48,127.80,128.05,128.54,128.70$,
