## Dedicated to Professor Christian Vogel on the occasion of his $60^{\text {th }}$ birthday

The $C$-glycosyl alkynecarboxylic acid orthoamides 22 and $\mathbf{2 3}$ are proposed as versatile precursors for the synthesis of new types of $C$-nucleoside analogs. The new synthetic strategy includes alkynylation of protected aldoses $\mathbf{1 3}$ or ketoses by Grignard ethynylation or Barbier propargylation, $O$-protection of the resulting alkynols $\mathbf{1 4 - 1 6}$, and nucleophilic addition of the metalated protected terminal alkynes $\mathbf{2 0}$ and $\mathbf{2 1}$ to peralkylguanidinium salt $\mathbf{2}$ to afford the corresponding alkynecarboxylic acid orthoamides 22 and 23, which in reactions with mono or bis-nucleophiles could serve as building blocks for the construction of a wide variety of $C$-nucleoside-like binary conjugates. All the steps are demonstrated on 2,4,3,5-bis(4-methoxybenzylidene)-protected L-xylose 11 as a model compound. The synthesis of a representative series of $C$-glycosidic conjugates of highly substituted "push-pull" 1,3-butadienes 32-35, pyrimidines 24-31, and 2-pyridones $\mathbf{3 6 - 3 9}$ is included. The stereochemistry of all described compounds is established by 2D-NMR techniques. A general character of the proposed synthetic strategy, when applied to different appropriately protected sugar derivatives, is suggested, and a biomedical applicability of the described type of conjugates is expected.

Key words: $N, N, N^{\prime}, N^{\prime}, N^{\prime \prime}, N^{\prime \prime}$-Hexamethylguanidinium Chloride, Alkynecarboxylic Acid Orthoamides, $O$-Protected Aldose, Ethynylation, Propargylation, Stereochemical Assignment, $C$-Nucleosides

## Introduction

The antibacterial, antiviral and cytostatic activities observed in a number of naturally occurring $C$ nucleosides triggered considerable interest in the design, synthesis and biological evaluation of new $C$ nucleoside analogs. Thus, the combinatorial $\mathrm{C}-\mathrm{C}$ bond fusion of natural or chemically modified, cyclic or open-chain sugar moieties to diverse biomedically interesting aglycones has become a valuable source of new, $C$-nucleoside-like derivatives that are potentially applicable in therapy. In this regard, new synthetic strategies for the construction of a $C$-nucleoside type of binary conjugates are continuously well appreciated [2-16].

Previous studies highlighted alkynecarboxylic acid orthoamides 3 (Scheme 1) as very useful reagents in organic synthesis. They are readily accessible by nucleophilic addition of metalated terminal alkynes $\mathbf{1}$ to peralkylated guanidinium salts 2 (Scheme 1) [17-21]. Alkynecarboxylic acid orthoamides $\mathbf{3}$ behave as electrophilic reagents, equivalent to the corresponding resonance-stabilized propiolamidinium species $\mathbf{3 b}$. Due to delocalization of the positive charge, both $\mathrm{C}(1)$ and/or $\mathrm{C}(3)$ atoms in the resonance forms $\mathbf{3 a} \leftrightarrow \mathbf{3 b}$ can be involved in reactions with monoand bis-nucleophiles. These chemical features of the alkynecarboxylic acid orthoamides have been already utilized in the synthesis of a variety of "push-pull" 1,3-butadienes $\mathbf{4 a}$ and $\mathbf{4 b}$, and in reactions with $\mathrm{CH}_{2}$

Scheme 1. Diversity of some previously described condensation products from alkynecarboxylic acid orthoamides $\mathbf{3}$ [17-21] $(\mathrm{EWG}=$ electron withdrawing group).
acids and various heterocyclic compounds. Thus, orthoamides $\mathbf{3}$ reacted with enamines to form pyridines 5 and $\mathbf{6}$, with amidines to pyrimidines 7 , with cyanoacetamide to 2 -pyridones $\mathbf{8}$, with hydrazines to pyrazoles 9 , etc. [17-21].
The fact that terminal alkyne derivatives of sugars are easily available by direct Grignard ethynylation [2-16, 22-29] or Barbier propargyla-
tion [30-32] of protected aldoses or ketoses led to the idea that sugar-derived alkynecarboxylic acid orthoamides 3 (Scheme 1), where R is a protected sugar residue, could serve as potentially convenient precursors in the synthesis of new types of $C$-nucleoside-like conjugates with literally unexplored biological activity (similar to the types of derivatives highlighted in Scheme 1, where R is a sugar residue). A previous
study illustrating this approach on one protected ketose example was encouraging [33]. Herein we describe the results of our efforts to expand this methodology to protected aldoses.

## Results and Discussion

Earlier reports have emphasized the antiviral activity of some benzylidene-protected aldopentoses and their derivatives [34, 35], which motivated us to choose
the 4-methoxybenzylidene protected L-xylose $\mathbf{1 3}$ as the starting material for the present study. Compound 13 was prepared by a published reaction sequence [36] (Scheme 2). A practical improvement was achieved in the first step where the acetalization of D-sorbitol (10) was performed more conveniently in acetic acid as catalyst and reaction medium, from which the desired 4-methoxybenzylidene-protected compound $\mathbf{1 1}$ separates in practically pure state and higher yield. The periodate oxidation of the vicinal diol 11 led to the

Scheme 2. Synthesis of 4-MeO-benzylidene-protected L-xylose $\mathbf{1 3}$ and its alkynylated derivatives 14-16. Some of the H atoms are omitted for clarity. Reagents and conditions: (a) 4-MeO-benzaldehyde, acetic acid, r.t., $48 \mathrm{~h}, 56 \%$; (b) $\mathrm{NaIO}_{4}, 80 \% \mathrm{aq}$. dioxane, r.t. 48 h , quant.; (c) toluene reflux with a Dean-Stark trap, $86 \%$; (d) ethynylmagnesium chloride, THF, r. t., 2.5 h ; (e) propargyl bromide, Zn dust, DMF-diethyl ether, $35^{\circ} \mathrm{C}$ to r.t. $84 \%$; (f) 4-nitrobenzoyl chloride, TEA, MeCN, r. t. overnight, $72 \%$; (g) $\mathrm{NaH}, \mathrm{DMF}$, MeI, r.t., $3 \mathrm{~h}, 94 \%$. The long-range heteronuclear correlation (2D HMBC) between $\mathrm{C}(3) \mathrm{H}, \mathrm{C}(1)$ and $\mathrm{C}(5)$ and between $\mathrm{C}(8) \mathrm{H}$ and $\mathrm{C}(10)$ atoms is illustrated on the structure of compound $\mathbf{1 5}$.
aldehyde hydrate 12, which according to [36] was dehydrated by azeotropic distillation with toluene to the desired protected aldopentose 13.

The reaction of aldehyde $\mathbf{1 3}$ with ethynylmagnesium chloride was almost quantitative, but showed poor diastereoselectivity and led to a mixture of two epimeric alkynols $\mathbf{1 4}$ and $\mathbf{1 5}$ in $c a .1: 1.8$ ratio (Scheme 2). Fortunately, we succeeded in the convenient large-scale separation of this mixture by simple recrystallization from methanol where the $1^{\mathrm{I}} S$-epimer 14 ( $27 \%$ isol.) crystallized almost quantitatively. The major $1^{\mathrm{I}} R$-epimer 15 was isolated from the mother liquor in $49 \%$ yield and used further in our study.

Additionally, with propargyl bromide and activated Zn dust in DMF-diethyl ether ( $1: 1$ ) mixture, analogously to a described procedure [30-32], the 4-methoxybenzylidene-protected L-xylose 13 was converted to the homoalkynol 16 in $84 \%$ yield. The reaction showed excellent diastereoselectivity, and the $1^{\mathrm{I}} R$ epimer was practically the sole product.

## Stereochemical assignment

Similar to cis-decalin, the unsubstituted cis-2,4,7,9tetraoxabicyclo[4.4.0]decane is expected to undergo conformational ring flip around the $\mathrm{C}(1)-\mathrm{C}(6)$ bond giving rise to a mixture of two conformers (12a and $\mathbf{1 2 b}, \mathrm{R}=\mathrm{H}$, Scheme 2, highlighted in rectangle). Earlier studies demonstrated that the "O-inside" conformer 12a ( $\mathrm{R}=\mathrm{H}$ ) is thermodynamically favored [37]. An equatorial substitution at $C(5)$ in 12a $(\mathrm{R} \neq \mathrm{H})$ would restrict additionally the ring inversion $\mathbf{1 2 a} \rightarrow \mathbf{1 2 b}$ due to steric repulsion between the axial substituents in 12b $(\mathrm{R} \neq \mathrm{H})$. All compounds in the present study are 3,5,8-trisubstituted cis-2,4,7,9tetraoxabicyclo[4.4.0]decane derivatives. Thus, the "O-inside" structures with axial $\mathrm{C}(1) \mathrm{H}$ and $\mathrm{C}(5) \mathrm{H}$ and equatorial $\mathrm{C}(6) \mathrm{H}$ are preferred. The crystal structure of the closely related compound 12c (Scheme 2, highlighted in rectangle) has been described and confirms such a molecular arrangement [38].
In order to determine the absolute configuration of the newly formed stereogenic center at $\mathrm{C}\left(1^{\mathrm{I}}\right)$ in the epimeric alkynols $\mathbf{1 4}, \mathbf{1 5}$, and $\mathbf{1 6}$, their 4 nitrobenzoyl derivatives 17,18 and 19 were prepared (Scheme 2 and Fig. 1). The entirely reverse magnetic anisotropy characteristics in the close proximity over the aromatic 4-nitrobenzoyl (shielding) and around the ethynyl (deshielding) [39] groups and
their inverted orientation in both epimeric derivatives 17 and 18 and the homologous 19 were expected to alter the chemical shifts of the eclipsed protons in a predictable manner. The long-range heteronuclear correlations ( $2 \mathrm{D} H M B C$ ) between $\mathrm{C}(3) \mathrm{H}$, $\mathrm{C}(1)$ and $\mathrm{C}(5)$ and between $\mathrm{C}(8) \mathrm{H}$ and $\mathrm{C}(10)$ atoms (shown in Scheme 2), which were observed in all here reported 5 -substituted 3,8-bis(4-methoxyphenyl)-cis-2,4,7,9-tetraoxabicyclo[4.4.0]decane derivatives, were particularly useful key spectral features for the identification of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR signals of the studied compounds. In the ${ }^{1} \mathrm{H}$ NMR spectra of all three compounds 17,18 and 19 , the $\mathrm{C}(3) \mathrm{H}$ signals are shifted downfield compared with the $\mathrm{C}(8) \mathrm{H}$ signals.

The ${ }^{1} \mathrm{H}$ NMR spectra of compounds $\mathbf{1 7}, \mathbf{1 8}$ and 19 show a $\mathrm{C}(5) \mathrm{H}-\mathrm{C}\left(1^{\mathrm{I}}\right) \mathrm{H}$ vicinal coupling constant $\left({ }^{3} J_{\mathrm{H}, \mathrm{H}}\right)$ of 8.8 Hz for $\mathbf{1 7}$ and $\mathbf{1 8}$, and 8.5 Hz for $\mathbf{1 9}$, which strongly indicates that in solution the almost antiperiplanar orientation of these protons in each of these compounds is favored. In such an arrangement the 4-nitrobenzoyl and the ethynyl substituents at $\mathrm{C}\left(1^{\mathrm{I}}\right)$ would diverge around the $\mathrm{C}(5)-\mathrm{C}\left(1^{\mathrm{I}}\right)$ bond axis eclipsing the benzylidene groups at $\mathrm{C}(3)$ and $\mathrm{C}(8)$. In the $1^{\mathrm{I}} R$-epimer 18 the 4 -nitrobenzoyl group (shielding) would be situated over $\mathrm{C}(8) \mathrm{H}$ and the ethynyl group (deshielding) over $\mathrm{C}(3) \mathrm{H}$, which would cause divergence of the chemical shifts of these signals whereas in the $1^{1} S$-epimer 17 the 4 -nitrobenzoyl group eclipsing $\mathrm{C}(3) \mathrm{H}$ and ethynyl group eclipsing $\mathrm{C}(8) \mathrm{H}$ should cause their convergence.

Fig. 1 shows fragments of the ${ }^{1} \mathrm{H}$ NMR spectra of compounds 17, 18 and 19, including the most indicative benzylidene $\mathrm{C}(3) \mathrm{H}, \mathrm{C}(8) \mathrm{H}$ and $\mathrm{C}\left(1^{\mathrm{I}}\right) \mathrm{H}$ signals. The $\mathrm{C}(3) \mathrm{H}(\delta=5.80 \mathrm{ppm})$ and $\mathrm{C}(8) \mathrm{H}(5.50 \mathrm{ppm})$ signals of the 4-nitrobenzoyl derivative $\mathbf{1 8}$ are significantly divergent (Fig. 1b) compared to the analogous signals of its epimeric compound 17 (Fig. 1a). Thus, compound $\mathbf{1 8}$ and its precursor $\mathbf{1 5}$ could be assigned the $1^{\mathrm{I}} R$-configuration.

The significant upfield shift of the $\mathrm{C}(8) \mathrm{H}$ signal (at 5.51 ppm ) of compound $\mathbf{1 9}$ and the large divergence between $\mathrm{C}(3) \mathrm{H}$ and $\mathrm{C}(8) \mathrm{H}$ signals (Fig. 1c) resemble the spectral features of compound $\mathbf{1 8}$ and are consistent with a 4-nitrobenzoyl moiety eclipsing the $\mathrm{C}(8)$ benzylidene group, which suggests that compound 19 has the same configuration at $\mathrm{C}\left(1^{\mathrm{I}}\right)$ as compound 18 and together with its precursor $\mathbf{1 6}$ also has $1^{1} R$ configuration. The presence of a methylene linker at $\mathrm{C}\left(1^{\mathrm{I}}\right)$ in compound 19 alters the spacial orientation

Fig. 1. Stereochemical assignment of the 4-nitrobenzoyl derivatives $\mathbf{1 7 , 1 8}$ and $\mathbf{1 9}$ based on the specific through-space influence of the 4-nitrobenzoyl (shielding) and ethynyl (deshielding) groups on the ${ }^{1} \mathrm{H}$ NMR chemical shift of the eclipsed protons at $\mathrm{C}(3)$ and $\mathrm{C}(8)$. Some of the H atoms are omitted for clarity.
of the alkyne group, which questions the degree of its through-space influence on the $\mathrm{C}(3) \mathrm{H}$ chemical shift.

## Synthesis of the C-nucleoside analogs

Our preliminary attempts to use a trimethylsilylprotected derivative of compound $\mathbf{1 5}$ (Scheme 2, where R is $\mathrm{SiMe}_{3}$ ) as starting material for the orthoamide preparation failed due to the instability of the protective group under the reaction conditions. Therefore the alkynols $\mathbf{1 5}$ and $\mathbf{1 6}$ were protected by $O$-methylation, and the corresponding $1^{\mathrm{I}}$-OMe derivatives 20 and 21 were used as starting material in the preparation of the orthoamides $\mathbf{2 2}$ and $\mathbf{2 3}$ (Scheme 3).

Under strictly anhydrous conditions in THF under $\mathrm{N}_{2}$ atmosphere the in situ-lithiated compounds 20 and 21 were introduced into the reactions with freshly dried $\left(110^{\circ} \mathrm{C}, 0.1\right.$ Torr, 2 h$)$ hexamethylguanidinium chloride (2), carried out for 7 days at r.t., similar to a previously reported procedure [17-21] (Scheme 3). The water sensitivity of the alkynecarboxylic acid orthoamides reduces the choice of isolation methods to distillation or occasionally crystallization. Extraction or chromatographic methods are inapplicable [17-21]. Unfortunately, our attempts to isolate the orthoamides $\mathbf{2 2}$ and $\mathbf{2 3}$ (Scheme 3) by crystallization were unsuccessful. Therefore we used the in situ prepared solutions of these compounds for further transformations.

The reactions of orthoamides 22 and 23 with 1,3bisnucleophiles of the type $\mathrm{RC}(=\mathrm{NH}) \mathrm{NH}_{2}$ (amidines and guanidines) in THF at $65^{\circ} \mathrm{C}$ (external) for 3 h led to smooth heterocyclization yielding the corresponding 6-dimethylamino-pyrimidine derivatives $\mathbf{2 4}$ - $\mathbf{3 1}$ in fair to good yields.

The reactions of orthoamides $\mathbf{2 2}$ and $\mathbf{2 3}$ with malononitrile in THF for 24 h at r.t. yielded the intensively yellow-orange ketene aminals $\mathbf{3 2}$ and $\mathbf{3 3}$ in good yields.

In the ambient-temperature ( 297 K ) ${ }^{1} \mathrm{H}$ NMR spectrum of compound 32, with a ketene aminal functionality directly attached to $\mathrm{C}\left(1^{\mathrm{I}}\right)$, the two $\mathrm{NMe}_{2}$ groups appear as a singlet at $\delta=2.90 \mathrm{ppm}$ and both display long range correlations (2D HMBC) with carbon atom $\mathrm{C}\left(4^{\mathrm{IV}}\right)$. Additionally, there is evidence for long range correlations between $\mathrm{C}\left(1^{\mathrm{I}}\right) \mathrm{H}$ and the butadiene quaternary $\mathrm{C}\left(1^{\mathrm{IV}}\right)$ and between $\mathrm{C}\left(3^{\mathrm{IV}}\right) \mathrm{H}$ and $\mathrm{C}\left(1^{\mathrm{IV}}\right)$. These spectral data indicate that the nucleophilic attack of the malononitrile takes place on the $\beta$-C atom of the or-
thoamide 22 with the exclusive formation of the ketene aminal 32 (similar to $\mathbf{4 a}$ in Scheme 1), and that at ambient temperature there is facile rotation around the $\mathrm{C}\left(3^{\mathrm{IV}}\right)-\mathrm{C}\left(4^{\mathrm{IV}}\right)$ bond of the butadiene residue, which is explicable by the fact that in the "push-pull" ketene aminals of this type all three $\mathrm{C}-\mathrm{C}$ bonds of the butadiene chain are equalized due to electron delocalization.

However, the ambient-temperature ( 296 K ) ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of the homologous compound 33 show the presence of two sets of analogous signals with nearly equal intensity, which clearly indicates that at this temperature in solution ( $\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ) compound 33 exists in two almost equally populated slowly interchangeable rotameric forms. The presence of a methylene linker group at $\mathrm{C}\left(1^{\mathrm{I}}\right)$ in this compound keeps the plane of the attached ketene aminal moiety nearly parallel to the $\mathrm{C}\left(1^{\mathrm{I}}\right)-\mathrm{OMe}$ bond axis, which apparently strongly restricts the free rotation around the $\mathrm{C}\left(2^{\mathrm{L}}\right)$ $\mathrm{C}\left(2^{\mathrm{IV}}\right)$ bond at ambient temperature. Here again, the long range correlation between both $\mathrm{NMe}_{2}$ groups with carbon atom $\mathrm{C}\left(4^{\mathrm{IV}}\right)$ confirms the ketene aminal structure of compound 33 .

The addition of cyanoacetamide to the THF solutions of orthoamides $\mathbf{2 2}$ and $\mathbf{2 3}$ at r.t. causes instant deep yellow-orange colorization of the mixtures. Presumably this is a result of the rapid formation of the ketene aminals 34 and 35 , respectively. However, in both cases the TLC analyses of the reaction mixtures showed, beside the intensively yellow ketene aminal spots, the presence of colorless products as single spots of blue fluorescence at 365 nm . After longer reaction times at r.t., the initial concentration of the yellow ketene aminal decreased at the expense of a constantly increasing concentration of the colorless products. Due to their spontaneous transformation, the isolation of the initial ketene aminals $\mathbf{3 4}$ and $\mathbf{3 5}$ was impossible. Therefore the solvent (THF) was removed under reduced pressure, replaced by 2-propanol, and the mixtures were heated for additional 2 h at $80^{\circ} \mathrm{C}$ for completion of the reaction. The elemental analyses and MS spectra of the isolated colorless terminal products were consistent with the expected 2-pyridone derivatives 36 and 37 . However, since cyanoacetamide is an unsymmetrical 1,3-bis-nucleophile with $\mathrm{CH}_{2}$ and $\mathrm{NH}_{2}$ acidic groups, under the strongly basic reaction conditions two plausible constitutional isomeric 2-pyridone structures for the products $\mathbf{3 6}$ and $\mathbf{3 7}$ were possible (Scheme 3, square and round brackets). The ${ }^{1} \mathrm{H}$ NMR spectra confirmed the presence of 2-pyridone moieties

Scheme 3. Synthesis of orthoamides $\mathbf{2 2}$ and $\mathbf{2 3}$ and their condensation reactions with different nucleophiles. Some of the H atoms are omitted for clarity. Reagents and conditions: (a) 1) $n$ - $\mathrm{BuLi}, \mathrm{THF},-40^{\circ} \mathrm{C} \rightarrow$ r.t., 2) hexamethylguanidinium chloride (2), 7 d, r.t.; (b) $\mathrm{R}(=\mathrm{NH}) \mathrm{NH}_{2}, \mathrm{THF}, 65^{\circ} \mathrm{C}, 3 \mathrm{~h}$; (c) malononitrile, THF, 24 h, r.t.; (d) cyanoacetamide, 1) THF, 24 h , r.t., 2) $2 \mathrm{-PrOH}, 80^{\circ} \mathrm{C}, 2 \mathrm{~h}$; (e) EtOH-aq. $37 \% \mathrm{HCl}, 48 \mathrm{~h}$, r.t. Note: In order to unify the description and discussion of the stereochemical and spectroscopic features, in both series of homologous $3,5,8$-trisubstituted cis-2,4,7,9-tetraoxabicyclo[4.4.0]decane-derived binary conjugates presented here, the conjunctive C atom is labelled as $\mathrm{C}\left(1^{1}\right)$. However, in compounds $\mathbf{2 5}, \mathbf{2 7}, \mathbf{2 9}, \mathbf{3 1}, \mathbf{3 3}$, and $\mathbf{3 7}$, this atom is part of an conjunctive ethyl chain and according to the UPAC nomenclature should be correctly numbered as $\mathrm{C}\left(2^{\mathrm{I}}\right)$. The correct UPAC names of those compounds are given with the corresponding procedures in the Experimental Section.
in both compounds $\mathbf{3 6}$ and $\mathbf{3 7}$ displaying $\mathrm{C}\left(5^{\mathrm{IV}}\right) \mathrm{H}$ (at $\delta=5.87$ and 5.65 ppm , respectively), NH (at 11.27 and 11.13 ppm , respect.), and $\mathrm{NMe}_{2}$ (at 3.05 and 2.95 ppm , respect.) signals. The infrared spectra, containing bands for $\mathrm{C} \equiv \mathrm{N}$ (at 2208 and $2211 \mathrm{~cm}^{-1}$ ) and $\mathrm{C}=\mathrm{O}$ groups (at 1599 and $1603 \mathrm{~cm}^{-1}$ ) were also in full agreement with the 2-pyridone structures but not sufficient to distinguish between the two possible isomers for compounds 36 and 37 . Surprisingly, at this point we were confronted with a problem that was nonsolvable by 2D NMR techniques, because in the ${ }^{13} \mathrm{C}$ NMR spectra of both compounds the signals for the C atoms of the 2 -pyridone moieties were missing. Only very weak signals of CN groups were observed. The $\mathrm{NMe}_{2}$ signals were overlapped by the solvent ( $\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ) signal. According to consulted NMR experts, the problem was attributed to a cross-relaxation phenomenon. However, the registration of the ${ }^{13} \mathrm{C}$ NMR spectra of compounds $\mathbf{3 6}$ and $\mathbf{3 7}$ with longer relaxation times from 1 s to 10 and 20 s and a larger number of scans, as recommended, did not improve the signal intensity. Spectral comparison with unsubstituted- and 4 -phenyl-substituted 2-pyridone [17] and 4-methyl-6-dimethylamino-2-pyridone and 4-dimethylamino-6-methyl-2-pyridone [40] was not sufficient for the unambiguous structural identification of compounds 36 and 37.
The treatment of compounds 36 and 37 with an ethanol-aq. $37 \% \mathrm{HCl}$ mixture for 48 h at r.t. yielded the unprotected open-chain nucleoside analogs, namely the L-xylose derivative $\mathbf{3 8}$ and the 6 -deoxy-D-sorbitol derivative 39, respectively. Fortunately, the ${ }^{13} \mathrm{C}$ NMR spectra of compounds 38 and 39 clearly display all C atom signals of the 2-pyridone moieties, which were completely assigned by 2D NMR techniques. The evident long range heteronuclear correlations between $\mathrm{C}(5) \mathrm{H}$ and $\mathrm{C}\left(5^{\mathrm{I}}\right) \mathrm{H}$ with $\mathrm{C}\left(3^{\mathrm{I}}\right)$ in the case of compound $\mathbf{3 8}$ and between $\mathrm{C}(6) \mathrm{H}_{2}$ and $\mathrm{C}\left(5^{\mathrm{I}}\right) \mathrm{H}$ with $\mathrm{C}\left(3^{\mathrm{I}}\right)$ in the case of compound 39 unquestionably demonstrated that in both $\mathbf{3 8}$ and $\mathbf{3 9}$ and their parent compounds $\mathbf{3 6}$ and $\mathbf{3 7}$ the 2-pyridone ring is attached to the sugar moieties at the $\mathrm{C}(4)$ position, as shown in Scheme 3. This fact illuminates the complete pattern of the reactions of orthoamides 22 and 23 with cyanoacetamide, which apparently involves initial nucleophilic attack from the cyanoacetamide acidic $\mathrm{CH}_{2}$ group exclusively at the $\beta$-C atom of the orthoamides 22 and 23 (which unambiguously proves the ketene aminal structures of the transient intermediates 34 and 35) and
secondary ring closure reactions from the amide $\mathrm{NH}_{2}$ groups to the terminal ketene aminal groups of the transient 34 and 35 . These reactions presumably operate via intermediate $\mathrm{C}\left(2^{\mathrm{IV}}\right)-\mathrm{C}\left(3^{\mathrm{IV}}\right)$-s-cis conformers (not shown) of the corresponding ketene aminals 34 and 35 .

In conclusion, the present study has demonstrated the applicability of alkynecarboxylic acid orthoamide chemistry as a potent road for the synthesis of a new type of $\mathrm{C}-\mathrm{C}$ bond sugar-conjugated heterocyclic compounds of potential biomedical interest. We have shown this with 2,4,3,5-bis(4-methoxybenzylidene)protected L-xylose as a model compound, but variations in the appropriately protected sugar derivatives are possible. Some of the new conjugated compounds reported herein were submitted for biological screening. The tests are in progress.

## Experimental Section

## General procedures

FT-IR spectra were recorded on a Perkin-Elmer 457 instrument. NMR spectra were recorded on Bruker AC 250 (operating at 250.13 MHz for ${ }^{1} \mathrm{H}$ and at 62.9 MHz for ${ }^{13} \mathrm{C}$ ) or Bruker ARX 500 (operating at 500.1 MHz for ${ }^{1} \mathrm{H}$ and 125.7 MHz for ${ }^{13} \mathrm{C}$ ) instruments. The spectra were calibrated using the solvent signal according to [41] or TMS as internal standard unless stated otherwise. For the assignment of ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR signals, DEPT and two-dimensional ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H}$ COSY, ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ correlation spectra (HSQC and HMBC) were recorded. Analytical thin-layer chromatography (TLC) was performed on pre-coated POLYGRAM ${ }^{\circledR}$ SIL G/UV 254 plastic sheets (Machery-Nagel), detection by UV light. Column chromatography was carried out on silica gel 60 ( $0.063-0.20 \mathrm{~mm}$ ), Macherey-Nagel. Melting points were determined with a Büchi 510 apparatus (Büchi Laboratoriumstechnik AG, Flawil/Switzerland) and are uncorrected. Elemental analyses were performed by the service of the Institut für Organische Chemie, University of Stuttgart. ESIMS spectra were measured on a micrOTOF-Q (Bruker Daltonics) instrument. Solvents and liquid reagents were purified and dried according to recommended procedures.
(1R)-1-[(1S,3S,5R,6R,8R)-3,8-Bis(4-methoxyphenyl)-2,4, 7,9-tetraoxabicyclo[4.4.0]decan-5-yl]-ethane-1,2-diol (11)

A mixture of D-sorbitol (10, $80 \mathrm{~g}, 0.44 \mathrm{~mol}), 4$-methoxybenzaldehyde $(240 \mathrm{~g}, 1.8 \mathrm{~mol})$, and acetic acid ( 800 mL ) was stirred at $70^{\circ} \mathrm{C}$ until a clear solution was obtained, and then at $\mathrm{r} . \mathrm{t}$. for 48 h . Ether ( $c a .200 \mathrm{~mL}$ ) was added. The jelly-like material was suspended, isolated by filtration, washed several times with an aqueous solution of $\mathrm{K}_{2} \mathrm{CO}_{3}$
and with hot water and air-dried overnight to yield compound 11. Yield $102 \mathrm{~g}(56 \%)$, colorless powder; m. p. 220$222^{\circ} \mathrm{C}$ (lit.: m.p. $185-187^{\circ} \mathrm{C}$ [36]). $-R_{\mathrm{f}}=0.5\left(\mathrm{CHCl}_{3}-\right.$ dioxane, 1:1). - FT-IR (ATR): $v=3514(\mathrm{OH}), 3311(\mathrm{OH}$ assoc.), 2972, 2932, 2837, 1614, 1517, 1246, 1089, 1061, 1035, $979,825,778,660 \mathrm{~cm}^{-1} .-{ }^{1} \mathrm{H}$ NMR $(250 \mathrm{MHz}$, [D ${ }_{6}$ ]DMSO): $\delta=7.39$ and $7.37[2 \mathrm{~d}, J=8.5 \mathrm{~Hz}, 4 \mathrm{H}$, $\left.\left.\mathrm{C}\left(2^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(6^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(2^{\mathrm{III}}\right) \mathrm{H}, \mathrm{C}\left(6^{\mathrm{III}}\right) \mathrm{H}\right)\right], 6.92[\mathrm{~d}, J=8.6 \mathrm{~Hz}$, $\left.4 \mathrm{H}, \mathrm{C}\left(3^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(5^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(3^{\mathrm{III}}\right) \mathrm{H}, \mathrm{C}\left(5^{\mathrm{III}}\right) \mathrm{H}\right], 5.59[\mathrm{~s}, 2 \mathrm{H}, \mathrm{C}(3) \mathrm{H}$ and $\mathrm{C}(8) \mathrm{H}], 4.82\left[\mathrm{~d}, J=5.4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}\left(1^{\mathrm{I}}\right) \mathrm{OH}\right], 4.41(\mathrm{t}$, $\left.J=5.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}\left(2^{\mathrm{I}}\right) \mathrm{OH}\right], 4.23-4.13[\mathrm{~m}, 3 \mathrm{H}, \mathrm{C}(1) \mathrm{H}+$ $\left.\mathrm{C}(10) \mathrm{H}_{2}\right], 3.89$ [bs, $\left.1 \mathrm{H}, \mathrm{C}(6) \mathrm{H}\right], 3.84-3.65[\mathrm{~m}, 8 \mathrm{H}, \mathrm{C}(5) \mathrm{H}$, $\mathrm{C}\left(1^{\mathrm{I}}\right) \mathrm{H}$ and $2 \mathrm{ArOCH}_{3}$ as s at $\left.3,75 \mathrm{ppm}\right)$ ], $3.64-3.52[\mathrm{~m}$, $1 \mathrm{H}, \mathrm{C}\left(2^{\mathrm{I}}\right) \mathrm{Ha}, 3.48-3.37\left[\mathrm{~m}, 1 \mathrm{H}, \mathrm{C}\left(2^{\mathrm{I}}\right) \mathrm{Hb}\right] .-{ }^{13} \mathrm{C}$ NMR ( $\left.62.89 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=159.37,159.32\left[\mathrm{C}\left(4^{\mathrm{II}}\right)\right.$ and $\left.\mathrm{C}\left(4^{\text {IIII }}\right)\right]$, 131.16, $130.90\left[\mathrm{C}\left(1^{\text {II }}\right)\right.$ and $\left.\mathrm{C}\left(1^{\text {III }}\right)\right]$, 127.47, 127.43 $\left[\mathrm{C}\left(2^{\mathrm{II}}\right), \mathrm{C}\left(6^{\mathrm{II}}\right), \mathrm{C}\left(2^{\mathrm{II}}\right), \mathrm{C}\left(6^{\mathrm{III}}\right)\right], 113.25,113.19\left[\mathrm{C}\left(3^{\mathrm{II}}\right)\right.$, $\left.\mathrm{C}\left(5^{\mathrm{II}}\right), \mathrm{C}\left(3^{\mathrm{III}}\right), \mathrm{C}\left(5^{\mathrm{III}}\right)\right], 99.25,99.20[\mathrm{C}(3)$ and $\mathrm{C}(8)], 77.58$ [C(5)], 69.95 [C(1)], 69.24 [C(10)], 68.27 [C(6)], 67.67 $\left[\mathrm{C}\left(1^{\mathrm{I}}\right)\right], 62.58\left[\mathrm{C}\left(2^{\mathrm{I}}\right)\right], 55.08\left(\mathrm{OCH}_{3}\right) .-\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{O}_{8}(418.43)$ : calcd. (1S,3S,5S,6R,8R)-3,8-Bis(4-methoxyphenyl)-2,4,7,9-tetraoxabicyclo[4.4.0]decane-5-carboxaldehyde (13)

A solution of $\mathrm{NaIO}_{4}(18 \mathrm{~g}, 84 \mathrm{mmol})$ in water $(160 \mathrm{~mL})$ was added to a stirred suspension of finely powdered compound $\mathbf{1 1}(25 \mathrm{~g}, 60 \mathrm{mmol})$ in $80 \%$ aqueous dioxane ( 500 mL ). Compound $\mathbf{1 1}$ gradually dissolved, and simultaneously the product (compound 12) began to crystallize. After 48 h stirring at r.t., the resulting suspension was filtered. The colorless crystalline product was washed with water and air-dried. The obtained aldehyde hydrate $\mathbf{1 2}$ was suspended in 400 mL of toluene and the mixture was refluxed with a Dean-Stark trap until complete removal of the water. The hot toluene solution was quickly filtered and left overnight at r.t. The resulting suspension was filtered, the solid material was washed with toluene and dried to yield aldehyde 13. Yield $19.83 \mathrm{~g}(86 \%)$, colorless crystalline powder; m. p. 186-188 ${ }^{\circ} \mathrm{C}$ (lit.: m. p. 167-168 ${ }^{\circ} \mathrm{C}$ [36]). -$R_{\mathrm{f}}=0.23\left(\mathrm{CHCl}_{3}-\mathrm{THF}, 10: 0.5\right)$. - FT-IR (ATR): $v=2968$, 2933, 2838, 1736 (C=O), 1614, 1585, 1515, 1401, 1168, 1246, 1096, 1065, 1032, 993, $829,815 \mathrm{~cm}^{-1}$. - ${ }^{1} \mathrm{H}$ NMR ( $250 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta=9.56$ (s, $1 \mathrm{H}, \mathrm{CH}=\mathrm{O}$ ), 7.45 and $7.30\left[2 \mathrm{~d}, J=8.6 \mathrm{~Hz}, 4 \mathrm{H}, \mathrm{C}\left(2^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(6^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(2^{\mathrm{III}}\right) \mathrm{H}\right.$, $\left.\left.\mathrm{C}\left(6^{\mathrm{III}}\right) \mathrm{H}\right)\right], 6.97$ and $6.91\left[2 \mathrm{~d}, J=8.7 \mathrm{~Hz}, 4 \mathrm{H}, \mathrm{C}\left(3^{\mathrm{II}}\right) \mathrm{H}\right.$, $\left.\mathrm{C}\left(5^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(3^{\mathrm{III}}\right) \mathrm{H}, \mathrm{C}\left(5^{\mathrm{III}}\right) \mathrm{H}\right], 5.73$ and $5.61[2 \mathrm{~s}, 2 \mathrm{H}, \mathrm{C}(3) \mathrm{H}$ and $\mathrm{C}(8) \mathrm{H}], 4.75[\mathrm{bd}, J=2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}(5) \mathrm{H}], 4.51[\mathrm{bt}, J=$ $1.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}(6) \mathrm{H}], 4.15\left[\mathrm{bt}, J=14.0 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}(10) \mathrm{H}_{2}\right]$, $4.00[\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}(1) \mathrm{H}], 3.76$ and $3.74\left(2 \mathrm{~s}, 6 \mathrm{H}, 2 \mathrm{ArOCH}_{3}\right)$. ${ }^{13} \mathrm{C}$ NMR ( $\left.62.89 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=199.49(\mathrm{C}=\mathrm{O})$, 159.65 and $159.48\left[\mathrm{C}\left(4^{\mathrm{II}}\right)\right.$ and $\left.\mathrm{C}\left(4^{\mathrm{II}}\right)\right], 130.51$ and 130.23 $\left[\mathrm{C}\left(1^{\mathrm{II}}\right)\right.$ and $\left.\mathrm{C}\left(1^{\mathrm{III}}\right)\right], 127.74$ and $127.37\left[\mathrm{C}\left(2^{\mathrm{II}}\right), \mathrm{C}\left(6^{\mathrm{II}}\right)\right.$,

(1S)-1-[(1S,3S,5R,6R,8R)-3,8-Bis(4-methoxyphenyl)-2,4,7, 9-tetraoxabicyclo[4.4.0]decan-5-yl]-1-hydroxy-prop-2-
yne (14) and ( $1 R$ )-1-[(1S,3S,5R,6R,8R)-3,8-Bis(4-methoxy-phenyl)-2,4,7,9-tetraoxabicyclo[4.4.0]decan-5-yl]-1-hydroxy-prop-2-yne (15)

A 0.6 M toluene/THF solution of ethinylmagnesium chloride ( $80 \mathrm{~mL}, 48 \mathrm{mmol}$ ) was added slowly at r.t. under $\mathrm{N}_{2}$ atmosphere to a suspension of finely powdered aldehyde 13 ( $16.8 \mathrm{~g}, 43.5 \mathrm{mmol}$ ) in anhydrous THF ( 10 mL ). The resulting clear, yellowish solution was stirred at r.t. for additional 2.5 h , then poured into a $1.5 \%$ aqueous solution of $\mathrm{NH}_{4} \mathrm{Cl}$ ( 1 L ). The precipitated material was isolated by filtration, washed with water and air-dried. The resulting slightly yellowish powder ( 20 g , water wet) was a mixture of the epimers 14 and 15 . The presence of water in this material seems to play an important role for the following separation of the epimers by recrystallization from methanol. Therefore the still water-wet crystalline mixture of compounds $\mathbf{1 4}$ and 15 was refluxed for 1 h in methanol ( 1 L ). The resulting suspension was cooled to r.t. and filtered. The collected solid material ( 6.15 g ) was once again refluxed for 1 h in methanol $(250 \mathrm{~mL})$, isolated by filtration, washed with methanol and dried to yield the pure epimer 14. The methanol mother liquor from the separation of the epimers was concentrated under reduced pressure. Toluene ( 300 mL ) was added to the solid residue, and the mixture was refluxed with a Dean-Stark trap for removal of the residual water. The clear yellow solution was left at r.t. The crystallized material was collected by filtration, washed with toluene and dried to yield the pure compound 15.

Data for compound 14: Yield 4.88 g ( $27 \%$ ), colorless crystals; m. p. $232-234^{\circ} \mathrm{C} .-R_{\mathrm{f}}=0.53\left(\mathrm{CHCl}_{3}-\mathrm{THF}, 9: 1\right)$. An $80 \%$ toluene solution of propargyl bromide $(11.8 \mathrm{~mL}$, $9.44 \mathrm{~g}, 80 \mathrm{mmol}$ ) was added to a suspension of compound $\mathbf{1 3}$ in a DMF-diethyl ether ( $1: 1$ ) mixture $(230 \mathrm{~mL})$. Zn powder ( $7.8 \mathrm{~g}, 120 \mathrm{mmol}$ ), previously quickly washed with 2 N aqueous HCl , several times with water and dried at $200^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ for 1 h , was added in small portions to the reaction mixture under stirring at $\mathrm{r} . \mathrm{t}$. After the addition of $c a .1 / 6$ of the Zn powder, the reaction mixture was gently warmed briefly with a fan heater, which initialized an exothermic reaction. The remaining metal powder was added slowly to prevent the reflux of the reaction mixture (less than $35^{\circ} \mathrm{C}$, if necessary the mixture should be externally cooled with ice water). After the addition of the whole amount of Zn powder, the mixture was stirred at r.t. for additional 2 h , then filtered through Celite ${ }^{\circledR}$ and the Celite ${ }^{\circledR}$ washed with DMF. The yellow-orange filtrate was poured into a $4 \%$ aqueous solution of $\mathrm{NH}_{4} \mathrm{Cl}(1 \mathrm{~L})$. The precipitated yellowish solid was collected by filtration, washed with water and $70 \%$ aqueous ethanol and air dried to yield the crude compound $\mathbf{1 6}$ as an ochre-colored powder ( $16 \mathrm{~g}, 97 \%$ ). The product was further purified by recrystallization from toluene to yield the pure compound 16. Yield 13.9 g ( $84 \%$ ), colorless crystals; m. p. $190-192{ }^{\circ} \mathrm{C} .-R_{\mathrm{f}}=0.45\left(\mathrm{CHCl}_{3}\right.$-THF, $\left.10: 1\right) .-{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta=7.39$ and $7.38[2 \mathrm{~d}, J=8.6 \mathrm{~Hz}$,

Preparation of THF solutions of (1R)-1-[(1S, 3S,5R,6R,8R)-3,8-bis(4-methoxyphenyl)-2,4,7,9-tetraoxabicyclo[4.4.0]-decan-5-yl]-1-methoxy-4,4,4-tris(dimethylamino)but-2-yne (22) and (1R)-1-[(1S,3S,5R,6R,8R)-3,8-bis(4-methoxyphe-nyl)-2,4,7,9-tetraoxabicyclo[4.4.0]decan-5-yl]-1-methoxy-5,5,5-tris(dimethylamino)pent-3-yne (23) - general procedure

A hexane solution ( 1.6 M ) of $n-\mathrm{BuLi}(15 \mathrm{~mL}, 24 \mathrm{mmol})$ was added dropwise under $\mathrm{N}_{2}$ at $-40^{\circ} \mathrm{C}$ to a solution of alkyne $\mathbf{2 0}(10 \mathrm{~g}, 23 \mathrm{mmol})$ or alkyne $\mathbf{2 1}(10.1 \mathrm{~g}, 23 \mathrm{mmol})$ in
anhydrous THF ( 250 mL ). The mixture was stirred at $-40^{\circ} \mathrm{C}$ for 30 min , then left to warm to r.t. The yellowish solution was transferred under $\mathrm{N}_{2}$ through a connecting glass tube to a flask containing previously dried $\left(110^{\circ} \mathrm{C}, 0.1\right.$ Torr, 2 h$)$ finely powdered hexamethylguanidinium chloride ( $\mathbf{2}, 8.3 \mathrm{~g}$, 46 mmol ). The suspension was stirred at r.t. under $\mathrm{N}_{2}$ for 7 days. Aliquots from the resulting stock solutions of orthoamide $\mathbf{2 2}$ or $\mathbf{2 3}$ were used in the following syntheses.

6-Dimethylamino-4-[(R)-methoxy-[(1S, 3S,5R,6R,8R)-3,8-bis(4-methoxyphenyl)-2,4,7,9-tetraoxabicyclo[4.4.0]-decan-5-yl]methyl]-2-methyl-pyrimidine (24)

Acetamidine hydrochloride ( $0.3 \mathrm{~g}, 3 \mathrm{mmol}$ ) was added to a solution obtained by addition of Na metal $(70 \mathrm{mg}$, $3 \mathrm{mmol})$ to ethanol $(20 \mathrm{~mL})$. The mixture was stirred at r.t. for 20 min , then the solvent was removed under reduced pressure. A solution of the orthoamide 22 ( 792 mg , 1.4 mmol ) in THF ( 16 mL ) was added under $\mathrm{N}_{2}$ to the residue, and the mixture was stirred at $65^{\circ} \mathrm{C}$ for 3 h . Water was added and the mixture was extracted twice with $\mathrm{CHCl}_{3}$. The organic extract was washed twice with water and concentrated under reduced pressure. The foam-like residue was dissolved in a minimum amount of $\mathrm{CHCl}_{3}$ and purified by flash chromatography on silica gel. The product was eluted consecutively with $\mathrm{CHCl}_{3}, \mathrm{CHCl}_{3}$-ethyl acetate (1:1), ethyl acetate, ethyl acetate-methanol (95:5). After the evaporation of the eluate the residue was triturated with diethyl ether, the solid material was collected by filtration, washed with diethyl ether and dried to yield compound 24. Yield 530 mg ( $70 \%$ ), colorless crystals; m. p. 192$194{ }^{\circ} \mathrm{C} .-R_{\mathrm{f}}=0.24$ (ethyl acetate). $-{ }^{1} \mathrm{H}$ NMR $(500 \mathrm{MHz}$, $\left.\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta=7.41$ and $7.18[2 \mathrm{~d}, J=8.8 \mathrm{~Hz}, 4 \mathrm{H}$, $\left.\mathrm{C}\left(2^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(6^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(2^{\mathrm{III}}\right) \mathrm{H}, \mathrm{C}\left(6^{\mathrm{III}}\right) \mathrm{H}\right], 6.96$ and $6.84[2 \mathrm{~d}, J=$ $\left.8.7 \mathrm{~Hz}, 4 \mathrm{H}, \mathrm{C}\left(3^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(5^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(3^{\mathrm{III}}\right) \mathrm{H}, \mathrm{C}\left(5^{\mathrm{III}}\right) \mathrm{H}\right], 6.52[\mathrm{~s}$, $\left.1 \mathrm{H}, \mathrm{C}\left(5^{\mathrm{IV}}\right) \mathrm{H}\right], 5.68[\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}(8) \mathrm{H}], 5.52[\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}(3) \mathrm{H}], 4.37$ and $4.38[\mathrm{dd}, J=9.25,1.5 \mathrm{~Hz}, \mathrm{C}(5) \mathrm{H}], 4.23[\mathrm{~d}, J=9.25 \mathrm{~Hz}$, $\left.\mathrm{C}\left(1^{\mathrm{I}}\right) \mathrm{H}\right], 4.20[\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}(6) \mathrm{H}], 4.19-4.12\left[\mathrm{~m}, 2 \mathrm{H}, \mathrm{C}(10) \mathrm{H}_{2}\right]$, $3.96[\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}(1) \mathrm{H}], 3.76$ and $3.70\left[2 \mathrm{~s}, 6 \mathrm{H}, 2 \mathrm{ArOCH}_{3}\right]$, $3.18\left[\mathrm{~s}, 3 \mathrm{H}, \mathrm{C}\left(1^{\mathrm{I}}\right) \mathrm{OC} H_{3}\right], 3.00\left[\mathrm{~s}, 6 \mathrm{H}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right], 2.36[\mathrm{~s}$, $\left.3 \mathrm{H}, \mathrm{C}\left(2^{\mathrm{II}}\right) \mathrm{CH}_{3}\right] .-{ }^{13} \mathrm{C}$ NMR ( $\left.125.76 \mathrm{MHz},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right)$ : $\delta=165.84\left[\mathrm{C}\left(2^{\mathrm{IV}}\right)\right], 164.08\left[\mathrm{C}\left(4^{\mathrm{IV}}\right)\right], 162.12\left[\mathrm{C}\left(6^{\mathrm{IV}}\right)\right]$, $159.36\left[\mathrm{C}\left(4^{\mathrm{II}}\right)\right.$ and $\left.\mathrm{C}\left(4^{\mathrm{III}}\right)\right], 131.03$ and $130.55\left[\mathrm{C}\left(1^{\mathrm{II}}\right)\right.$ and $\left.\mathrm{C}\left(1^{\mathrm{III}}\right)\right], 127.33$ and $127.25\left[\mathrm{C}\left(2^{\mathrm{II}}\right), \mathrm{C}\left(6^{\mathrm{II}}\right), \mathrm{C}\left(2^{\mathrm{III}}\right), \mathrm{C}\left(6^{\mathrm{III}}\right)\right]$, 113.35 and $113.20\left[\mathrm{C}\left(3^{\mathrm{II}}\right), \mathrm{C}\left(5^{\mathrm{II}}\right), \mathrm{C}\left(3^{\mathrm{III}}\right), \mathrm{C}\left(5^{\mathrm{III}}\right)\right], 99.59$ [C $\left.\left(5^{\mathrm{IV}}\right)\right], 99.15$ and $99.10[\mathrm{C}(3)$ and $\mathrm{C}(8)], 79,72\left[\mathrm{C}\left(1^{\mathrm{I}}\right)\right]$, 77.89 [C(5)], 69.67 [C(1)], 69.23 [C(10)], $68.58[\mathrm{C}(6)]$, $56.87\left[\mathrm{C}\left(1^{\mathrm{I}}\right) \mathrm{OCH}_{3}\right], 55.08$ and $55.05\left(2 \mathrm{ArOCH}_{3}\right), 36.55$ $\left(\mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right), 25.95\left[\mathrm{C}\left(2^{\mathrm{IV}}\right) \mathrm{CH}_{3}\right] .-\mathrm{C}_{29} \mathrm{H}_{35} \mathrm{~N}_{3} \mathrm{O}_{7}$ (537.60): calcd. 6-Dimethylamino-4-[(2R)-2-methoxy-2-[( $1 S, 3 S, 5 R, 6 R, 8 R)$ -3,8-bis(4-methoxyphenyl)-2,4,7,9-tetraoxabicyclo[4.4.0]-decan-5-yl]ethyl]-2-phenyl-pyrimidine (27)

Benzamidine hydrochloride ( $390 \mathrm{mg}, 2.5 \mathrm{mmol}$ ) was added to a solution obtained by addition of Na metal $(60 \mathrm{mg}, 2.6 \mathrm{mmol})$ to ethanol $(10 \mathrm{~mL})$. After stirring at r.t. for 30 min . the solvent was removed under reduced pressure. A solution of the orthoamide $23(713 \mathrm{mg}, 1.2 \mathrm{mmol})$ in THF ( 14 mL ) was added, and the mixture was stirred under $\mathrm{N}_{2}$ at $65^{\circ} \mathrm{C}$ for 3 h . Water was added, and the mixture was extracted twice with $\mathrm{CHCl}_{3}$. The combined organic extracts were washed twice with water and concentrated under reduced pressure. The residue was dissolved in a minimal amount of $\mathrm{CHCl}_{3}$ and purified by flash chromatography on silica gel by consecutive elution with $\mathrm{CHCl}_{3}, \mathrm{CHCl}_{3}-$ ethyl acetate ( $95: 5$ ), and $\mathrm{CHCl}_{3}$-ethyl acetate ( $9: 1$ ). After the concentration of the eluate under reduced pressure, the residue was recrystallized from ethanol to yield compound 27. Yield 300 mg ( $41 \%$ ), colorless crystals; m. p. 138-

6-Dimethylamino-4-[(R)-methoxy-[(1S,3S,5R,6R,8R)-3,8-bis(4-methoxyphenyl)-2,4,7,9-tetraoxabicyclo[4.4.0]decan-5-yl]methyl]-2-(1-piperidyl)pyrimidine (30)

Piperidine-1-carboxamidine sulfate ( $2 \mathrm{~g}, 5.7 \mathrm{mmol}$ ) was added to a solution obtained by addition of Na metal $(300 \mathrm{mg}, 13 \mathrm{mmol})$ to ethanol $(30 \mathrm{~mL})$. The mixture was stirred for 30 min at r.t., then evaporated to dryness. Acetonitrile ( 30 mL ) was added to the residue, the mixture was stirred for a few minutes and then filtered. The clear filtrate was evaporated to yield piperidine-1-carboxamidine base as a colorless solid ( $1.3 \mathrm{~g}, 90 \%$ ). Piperidine-1-carboxamidine base ( $0.9 \mathrm{~g}, 7 \mathrm{mmol}$ ) was added to a solution of the orthoamide 22 ( $682 \mathrm{mg}, 1.2 \mathrm{mmol}$ ) in THF ( 14 mL ), and the mixture was stirred at $55^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ for 21 h . Water was added, and the mixture was extracted twice with $\mathrm{CHCl}_{3}$. The combined organic extracts were washed with water and concentrated under reduced pressure. Methanol was added to the residue, and the suspension was heated to reflux. After cooling to r.t. the suspension was filtered. The solid material was washed with methanol and diethyl ether and dried to yield compound $\mathbf{3 0}$. Yield $510 \mathrm{mg}(70 \%)$, yellowish crystals; m. p. $194-196^{\circ} \mathrm{C} .-R_{\mathrm{f}}=0.68\left(\mathrm{CHCl}_{3}-\mathrm{THF}, 1: 1\right)$. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta=7.40$ and 7.21 [2d, $\left.J=8.7 \mathrm{~Hz}, 4 \mathrm{H}, \mathrm{C}\left(2^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(6^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(2^{\mathrm{III}}\right) \mathrm{H}, \mathrm{C}\left(6^{\mathrm{III}}\right) \mathrm{H}\right], 6.96$ and $6.85\left[2 \mathrm{~d}, J=8.7 \mathrm{~Hz}, 4 \mathrm{H}, \mathrm{C}\left(3^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(5^{\mathrm{II}}\right) \mathrm{H}, \mathrm{C}\left(3^{\mathrm{III}}\right) \mathrm{H}\right.$, $\left.\mathrm{C}\left(5^{\mathrm{III}}\right) \mathrm{H}\right], 5.97\left[\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}\left(5^{\mathrm{IV}}\right)\right], 5.67[\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}(8) \mathrm{H}], 5.51$ [s, $1 \mathrm{H}, \mathrm{C}(3) \mathrm{H}], 4.33$ and 4.32 [dd, $J=9.5,1.5 \mathrm{~Hz}, \mathrm{C}(5) \mathrm{H}]$, 4.19, $[\mathrm{s}, 1 \mathrm{H}, \mathrm{C}(6) \mathrm{H}], 4.18$ and $4.14[\mathrm{dd}, 2 \mathrm{H}, J=12.3$, $\left.1.3 \mathrm{~Hz}, \mathrm{C}(10) \mathrm{H}_{2}\right], 4.09\left[\mathrm{~d}, J=9.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}\left(1^{\mathrm{I}}\right) \mathrm{H}\right], 3.95$ [s, $1 \mathrm{H}, \mathrm{C}(1) \mathrm{H}], 3.76$ and $3.71\left(2 \mathrm{~s}, 6 \mathrm{H}, 2 \mathrm{ArOCH}_{3}\right), 3.67$ (bt, $\left.J=5.0 \mathrm{~Hz}, 4 \mathrm{H}, \mathrm{N}-\mathrm{CH}_{2}\right), 3.22\left[\mathrm{~s}, 3 \mathrm{H}, \mathrm{C}\left(1^{\mathrm{I}}\right) \mathrm{OCH}_{3}\right]$, $2.96\left[\mathrm{~s}, 6 \mathrm{H}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right], 1.57\left[\mathrm{~m}, 2 \mathrm{H}\right.$, piperidine, $\left.\gamma-\mathrm{CH}_{2}\right]$, $1.45\left[\mathrm{~m}, 4 \mathrm{H}\right.$, piperidine, $\left.\beta-\mathrm{CH}_{2}\right] .-{ }^{13} \mathrm{C}$ NMR ( 125.76 MHz , [D $\mathrm{D}_{6}$ ]DMSO): $\delta=164.88,162.84,160.94\left[\mathrm{C}\left(2^{\mathrm{IV}}\right), \mathrm{C}\left(6^{\mathrm{IV}}\right)\right.$, $\left.\mathrm{C}\left(4^{\mathrm{IV}}\right)\right], 159.36$ and $159.35\left[\mathrm{C}\left(4^{\mathrm{II}}\right)\right.$ and $\left.\mathrm{C}\left(4^{\mathrm{II}}\right)\right], 131.03$ and $130.65\left[\mathrm{C}\left(1^{\mathrm{II}}\right)\right.$ and $\left.\mathrm{C}\left(1^{\mathrm{III}}\right)\right], 127.36$ and $127.23\left[\mathrm{C}\left(2^{\mathrm{II}}\right)\right.$, $\left.\mathrm{C}\left(6^{\mathrm{II}}\right), \mathrm{C}\left(2^{\mathrm{III}}\right), \mathrm{C}\left(6^{\mathrm{III}}\right)\right], 113.37$ and $113.17\left[\mathrm{C}\left(3^{\mathrm{II}}\right), \mathrm{C}\left(5^{\mathrm{II}}\right)\right.$, $\left.\mathrm{C}\left(3^{\mathrm{III}}\right), \mathrm{C}\left(5^{\mathrm{II}}\right)\right], 99.23$ and $99.19[\mathrm{C}(3)$ and $\mathrm{C}(8)], 91.49$ $\left[\mathrm{C}\left(5^{\mathrm{IV}}\right)\right], 79.89\left[\mathrm{C}\left(1^{\mathrm{I}}\right)\right], 78.07[\mathrm{C}(5)], 69.72[\mathrm{C}(1)], 69.29$ [C(10)], $68.69[\mathrm{C}(6)], 56.87\left[\mathrm{C}\left(1^{\mathrm{I}}\right) \mathrm{OCH}_{3}\right], 55.07\left[\mathrm{ArOCH}_{3}\right]$, 44.25 (piperidine, $\left.\mathrm{N}-\mathrm{CH}_{2}\right), 36.47\left[\mathrm{~N}\left(\mathrm{CH}_{3}\right)_{2}\right], 25.26$ [piperidine, $\gamma-\mathrm{CH}_{2}$ ], 24.52 [piperidine, $\beta-\mathrm{CH}_{2}$ ]. $-\mathrm{C}_{33} \mathrm{H}_{42} \mathrm{~N}_{4} \mathrm{O}_{7}$ (606.70): calcd.
