#### Abstract

A polyoxometalate-based copper(II) inorganic-organic hybrid polymer $\left[\mathrm{Cu}(\mathrm{dpdo})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]$ $\left[\mathrm{Na}_{2}\left(\mathrm{Mo}_{8} \mathrm{O}_{26}\right) \cdot\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right] \cdot($ dpdo $) \cdot 2 \mathrm{H}_{2} \mathrm{O}(\mathbf{1})\left(\right.$ dpdo $=4,4^{\prime}$-bipyridine- $N, N^{\prime}$-dioxide) has been synthesized and structurally characterized by IR spectroscopy, elemental analysis, and single-crystal X-ray analysis. The structure is based on two types of polymeric chains, the anionic one constructed by the coordination interaction between the $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ cluster anions and $\left[\mathrm{Na}_{2}\right]^{2+}$ units, and the cationic one formed through the coordination interaction of $\mathrm{Cu}(\mathrm{II})$ atoms and dpdo ligands. In addition, there are multiform hydrogen bonds and $\pi \cdots \pi$ interactions in a three-dimensional supramolecular network.

Key words: $\beta$-Octamolybdate, Copper(II), Polymer, Crystal Structure

## Introduction

In polyoxometalate (POM) chemistry, much interest at present is focused on the design and synthesis of POM-based inorganic-organic hybrid compounds not only for their intriguing structure motifs, but also for their potential applications in the fields of catalysis, electrochemistry, magnetism, and functional materials [1-8]. Octamolybdate $\left[\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$, as an important category of polymolybdate clusters, constitutes a variety of inorganic-organic hybrid compounds due to its various isomeric forms $\alpha, \beta, \gamma$, $\delta, \varepsilon, \zeta, \xi, \eta$ [9]. Among them, $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ is an outstanding inorganic building block owing to its accessibility and stability for constructing interesting POM-based inorganic-organic hybrid compounds by the introduction of N -containing ligands such as 1,3-bis(imidazol-1-yl-methyl)benzene [10], benzimidazole [11], 4,4'-bipyridine [12], $N$-(2-(nicotinamido)ethyl)nicotinamide [13], 1,4-bis(imidazole-1ylmethyl)benzene [14], or 1,4-bis(1,2,4-triazol-1-yl-methyl)-benzene [15, 16].
$4,4^{\prime}$-Bipyridine- $N, N^{\prime}$-dioxide (dpdo) is a neutral bridging ligand for the construction of inorganicorganic hybrid frameworks because of its small size
that avoids crowding at the metal centers and encourages high connectivity. Some POM-based hybrid compounds have been reported by the incorporation of metal-dpdo systems and Keggin-type heteropolyanions such as $\left[\mathrm{PW}_{12} \mathrm{O}_{40}\right]^{3-},\left[\mathrm{PMo}_{12} \mathrm{O}_{40}\right]^{3-}$, $\left[\mathrm{SiMo}_{12} \mathrm{O}_{40}\right]^{4-}$, and $\left[\mathrm{BW}_{12} \mathrm{O}_{40}\right]^{5-}[17,18]$, however, metal-dpdo POM compounds using $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ as the inorganic component have not been reported so far. As part of our studies on the construction of POMbased inorganic-organic hybrid compounds [19-21], herein we report the synthesis and crystal structure of the coordination polymer $\left[\mathrm{Cu}(\mathrm{dpdo})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]$ $\left[\mathrm{Na}_{2}\left(\mathrm{Mo}_{8} \mathrm{O}_{26}\right) \cdot\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right] \cdot($ dpdo $) \cdot 2 \mathrm{H}_{2} \mathrm{O}$ (1) based on $4,4^{\prime}$-bipyridine- $N, N^{\prime}$-dioxide and $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ units.

## Experimental Section

General
Materials: All chemicals were of reagent grade quality obtained from commercial sources and used without further purification. 4,4'-Bipyridine- $N, N^{\prime}$-dioxide (dpdo) was prepared according to the literature method [22].

Instrumentation: Elemental analyses ( $\mathrm{C}, \mathrm{H}$ and N ) were carried out on a Perkin-Elmer 240C analytical instrument. IR spectra were recorded on KBr pellets with a Nicolet 170 SXFT-IR spectrophotometer in the $4000-400 \mathrm{~cm}^{-1}$ region.

## Synthesis

A 5 mL aqueous solution of $\mathrm{Na}_{2} \mathrm{MoO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}(1.16 \mathrm{~g}$, $4.8 \mathrm{mmol})$ and $\mathrm{KCl}(0.06 \mathrm{~g}, 0.78 \mathrm{mmol})$ was adjusted to $\mathrm{pH}=6.3$ with $12 \mathrm{~mol} \cdot \mathrm{~L}^{-1} \mathrm{HCl}$ and then heated at $80^{\circ} \mathrm{C}$ for 10 min and filtered. $\mathrm{KCl}(1.28 \mathrm{~g}, 17 \mathrm{mmol})$ was added. The resulting solution was left for 8 h at room tem-

## X-Ray crystallographic study

A suitable crystal of size $0.12 \times 0.15 \times 0.20 \mathrm{~mm}^{3}$ was chosen for the crystallographic study and mounted on a Bruker Smart APEX II CCD diffractometer. All diffraction measurements were performed at room temperature using graphite-monochromatized $\mathrm{Mo} K_{\alpha}$ radiation ( $\lambda=0.71073 \AA$ ). The structure was solved by Direct Methods and refined on $F^{2}$ by using full-matrix least-squares methods with the program Shelxi/s-97 [23, 24]. All nonhydrogen atoms were refined anisotropically, and all hydrogen atoms were geometrically fixed to allow riding on the parent atoms to which they are attached. Atom $\mathrm{O}(6 \mathrm{~W})$ was refined with restraints for the anisotropic displacement parameters. Space group, lattice parameters and other relevant information are listed in Table 1, and selected bond lengths and angles are given in Table 2.

## Results and Discussion

## IR spectrum

The IR spectrum of polymer 1 exhibits characteristic bands of $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$. Those at 945 , 915,839 and $714 \mathrm{~cm}^{-1}$ should be attributed to stretching vibrations of $\mathrm{Mo}=\mathrm{O}_{t}$ (terminal oxygen), $\mathrm{Mo}-\mathrm{O}_{a}\left(\mu_{2}\right), \mathrm{Mo}-\mathrm{O}_{b}\left(\mu_{3}\right)$ and $\mathrm{Mo}-\mathrm{O}_{c}\left(\mu_{5}\right)$, which are similar to those of $\left[\mathrm{Co}(\mathrm{en})_{3} \mathrm{Mo}_{8} \mathrm{O}_{26}\right.$ $\left.\left(\mathrm{H}_{3} \mathrm{O}\right) \mathrm{Cl}\right](\mathrm{DMF})_{4}\left(\mathrm{H}_{2} \mathrm{O}\right)$ [25]. The bands at 1471, 1220 and $1181 \mathrm{~cm}^{-1}$ are assigned to $v($ ring $), v(\mathrm{~N}-\mathrm{O})$ and $\delta(\mathrm{C}-\mathrm{H})$ from dpdo, which agrees well with that of related compounds [26]. The band appearing at $3427 \mathrm{~cm}^{-1}$ which corresponds to the $v(\mathrm{OH})$ stretching frequency indicates the presence of water molecules. These results were finally confirmed by X-ray crystallography.

## Crystal and molecular structure

Single-crystal X-ray diffraction analysis has revealed that $\left[\mathrm{Cu}(\text { dpdo })_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]\left[\mathrm{Na}_{2}\left(\mathrm{Mo}_{8} \mathrm{O}_{26}\right)\right.$. $\left.\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right] \cdot($ dpdo $) \cdot 2 \mathrm{H}_{2} \mathrm{O} \quad(\mathbf{1})$ is a 1 D coordination polymer based on two types of chains. The anionic chain is formed through the coordination interaction between the $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ cluster anions and $\mathrm{Na}^{+}$ cations, and the cationic chain is formed through the coordination interaction of $\mathrm{Cu}(\mathrm{II})$ cations and dpdo ligands.

Polymer 1 crystallizes in the triclinic space group $P \overline{1}$, and the asymmetric unit consists of one half [ $\beta$ $\left.\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ cluster anion, one $\mathrm{Na}(\mathrm{I})$ cation, one $\mathrm{Cu}(\mathrm{II})$ cation, one half coordinated dpdo, one uncoordinated dpdo, five coordinated water molecules, and one solvate water molecule. The Cu atom is located on a center of inversion. The coordination environments of the $\mathrm{Cu}(\mathrm{II})$ and $\mathrm{Na}(\mathrm{I})$ atoms are depicted in Fig. 1. Both have a distorted six-coordinated octahedral geometry.

The polyoxoanion $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ is a well-known structure composed of eight distorted edge-sharing $\mathrm{MoO}_{6}$ octahedra. The $\mathrm{Mo}-\mathrm{O}$ distances can be

Fig. 1. The structure of $\mathbf{1}$ and the coordination environment of the $\mathrm{Na}(\mathrm{I})$ and $\mathrm{Cu}(\mathrm{II})$ centers. Hydrogen atoms and solvate water molecules are omitted for clarity (symmetry codes: A: $1-x,-y, 1-z ; \mathrm{B}:-x, 1-y, 1-z$ ).
grouped into four sets according to the kind of oxygen atoms bound to the molybdenum atoms, with $\mathrm{Mo}-\mathrm{O}_{t}$ (terminal oxygen) of $1.686(3)-1.706(3) \mathrm{A}$, $\mathrm{Mo}-\mathrm{O}\left(\mu_{2}\right)$ of 1.746(3)-2.288(3) $\AA, \quad \mathrm{Mo}-\mathrm{O}\left(\mu_{3}\right)$ of $1.944(3)-2.364(3) \AA$, and $\mathrm{Mo}-\mathrm{O}\left(\mu_{5}\right)$ of $2.146(3)-2.479(3) \AA$. The bond angles $\mathrm{O}-\mathrm{Mo}-\mathrm{O}$ are in the range of $71.44-173.59^{\circ}$.

The Na atom is bound to two oxygen atoms $\mathrm{O}(1), \mathrm{O}(3)$ of one $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ and four oxygen atoms $\mathrm{O}(1 \mathrm{~W}), \mathrm{O}(2 \mathrm{~W}), \mathrm{O}(3 \mathrm{~W}), \mathrm{O}(3 \mathrm{WA})$ of four coordinated water molecules. The distances $\mathrm{Na}-\mathrm{O}$ are in the range of $2.321(6)-2.451(4) \AA$. Pairs of Na atoms are bridged by a pair of $\mu-\mathrm{O}(3 \mathrm{~W})$ donors from two $\mathrm{H}_{2} \mathrm{O}$ ligands with an $\mathrm{Na}(1) \cdots \mathrm{Na}(1 \mathrm{~A})$ dis-

Table 3. Hydrogen bonding interactions ( $\AA$ and deg) for 1.

Fig. 2. View of the $\mathrm{O}(4 \mathrm{~W})-\mathrm{H}(4 \mathrm{WA}) \cdots$ $\mathrm{O}(10)$ hydrogen bonds (dashed lines) in compound 1.

Fig. 3. View of the two types of ionic chain and dpdo molecules in $\mathbf{1}$ with $\pi \cdots \pi$ interactions and partial $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (dashed lines). The solvate water molecules have been omitted.
tance of $3.40 \AA$ and $\mathrm{Na}(1)-\mathrm{O}(3 \mathrm{~W})-\mathrm{Na}(1 \mathrm{~A})$ angles of $89.5^{\circ}$ (symmetry code: $2-x, 1-y,-1-z$ ). Consequently, two $\mathrm{NaO}_{6}$ octahedra are edge-sharing to obtain a dinuclear unit $\left[\mathrm{Na}_{2}\right]^{2+}$, which has also been shown previously [27, 28]. Each of these units connects two adjacent $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ anions, and each $[\beta$ $\left.\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ polyoxoanion acts as a tetradentate ligand to link two $\left[\mathrm{Na}_{2}\right]^{2+}$ units to form a one-dimensional anionic structure. The $\mathrm{O}(2 \mathrm{~W}), \mathrm{O}(3 \mathrm{~W})$ atoms of water molecules coordinated to $\mathrm{Na}^{+}$cations form three types of $\mathrm{O}(2 \mathrm{~W})-\mathrm{H}(2 \mathrm{WB}) \cdots \mathrm{O}(5), \mathrm{O}(3 \mathrm{~W})-\mathrm{H}(3 \mathrm{WC}) \cdot$ $\cdot \mathrm{O}(5)$ and $\mathrm{O}(3 \mathrm{~W})-\mathrm{H}(3 \mathrm{WC}) \cdots \mathrm{O}(7)$ hydrogen bonds with $\mathrm{O}(5)$ and $\mathrm{O}(7)$ of $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$, respectively (Table 3). These hydrogen bonding interactions also play an important role in stabilizing the polymeric structure.

The Cu atom is surrounded by six oxygen atoms from two dpdo ligands $[\mathrm{O}(14), \mathrm{O}(14 \mathrm{~A})$ ] and four coordinated water molecules $[\mathrm{O}(4 \mathrm{~W}), \mathrm{O}(4 \mathrm{WA}), \mathrm{O}(5 \mathrm{~W})$, $\mathrm{O}(5 \mathrm{WA})$ ] to obtain an octahedral coordination geometry. The axial $\mathrm{Cu}(1)-\mathrm{O}(4 \mathrm{~W})$ distance is $2.356(7) \AA$, whereas the average equatorial $\mathrm{Cu}(1)-\mathrm{O}$ distance is $1.941 \AA$. These data reveal that the $\mathrm{Cu}(\mathrm{II})$ center is subject to a strong John-Teller effect. Adjacent copper cations are linked by bridging dpdo ligands to gener-
ate a 1D cationic structure with $\mathrm{Cu} \cdots \mathrm{Cu}$ distances of 12.45 Å.

In the solid state, multiform intermolecular hydrogen bonds are formed between the anionic and cationic chains and uncoordinated dpdo components, respectively. Besides the above-mentioned $\mathrm{O}(2 \mathrm{~W})-\mathrm{H}(2 \mathrm{WB}) \cdots \mathrm{O}(5)$ hydrogen bonds within the anionic chain, the $\mathrm{O}(2 \mathrm{~W})$ atom as electron donor forms $\mathrm{O}(2 \mathrm{~W})-\mathrm{H}(2 \mathrm{WC}) \cdots \mathrm{O}(4 \mathrm{~W})$ hydrogen bonds with $\mathrm{O}(4 \mathrm{~W})$ of the cationic chain. At the same time, $\mathrm{O}(4 \mathrm{~W})$ is linked to $\mathrm{O}(10)$ of $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ of the anionic chain (Fig. 2). The $\mathrm{O}(15)$ and $\mathrm{O}(16)$ atoms of the uncoordinated dpdo molecule form dual hydrogen bonds with $\mathrm{O}(1 \mathrm{~W})$ of the anionic chain and $\mathrm{O}(5 \mathrm{~W})$ of the cationic chain, respectively. Furthermore, the $[\mathrm{N}(1) \mathrm{C}(1)-\mathrm{C}(5)]$ ring of the coordinated dpdo forms two types of $\pi \cdots \pi$ interactions with the two pyridyl rings $[\mathrm{N}(2) \mathrm{C}(6)-\mathrm{C}(10)]$ and $[\mathrm{N}(3) \mathrm{C}(11)-\mathrm{C}(15)]$ of the uncoordinated dpdos with center-to-center separations of 3.78 and $3.65 \AA$, dihedral angels of 0.96 and $6.78^{\circ}$, and shortest atom $\cdots$ atom interplanar separations of 3.40 and $3.34 \AA$. The $\mathrm{O}(6 \mathrm{~W})$ atom of the solvate water molecule forms three types of $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds with $\mathrm{O}(3 \mathrm{~W})$ of an anionic chain, $\mathrm{O}(4 \mathrm{~W})$ of a cationic chain and $\mathrm{O}(15)$ of an uncoordinated
dpdo molecule (Fig. 3). The oxygen atoms of the polyoxoanions feature multiple intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds. Accordingly, these abundant hydrogen bonds and $\pi \cdots \pi$ interactions link adjacent chains and uncoordinated dpdo to form a 3D supramolecular structure.

## Conclusions

In summary, we have presented a new example of a metal-dpdo POM compound, $\left[\mathrm{Cu}(\mathrm{dpdo})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]$ $\left[\mathrm{Na}_{2}\left(\mathrm{Mo}_{8} \mathrm{O}_{26}\right) \cdot\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right] \cdot($ dpdo $) \cdot 2 \mathrm{H}_{2} \mathrm{O}$ (1), with $[\beta$ $\left.\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ as an inorganic building block. The structure of $\mathbf{1}$ has been established by single-crystal X-
ray diffraction analysis and also characterized by IR spectroscopy. The coordination polymer consists of anionic and cationic chains. The anionic chain is constructed by the coordination interaction between the $\left[\beta-\mathrm{Mo}_{8} \mathrm{O}_{26}\right]^{4-}$ cluster anions and pairs of $\mathrm{Na}^{+}$cations, and the cationic chain is formed through the coordination interaction of $\mathrm{Cu}^{2+}$ cations and dpdo ligands.
